

# AGRISOL NEWS

Whatever your school of thinking, time has definitely moved into the new millennium and we should be looking to a rewarding and profitable future. Being on the land often tests our resilience to face the unknown and unexpected. It is these challenges which often make us more determined to stay on the land and face its vagaries even though it would be much easier to pack up and leave. Some would call staying 'stupidity', others sheer 'pigheadedness' and yet many of us consider it 'lifestyle'.

Just like the significant changes that occurred in the farming community during the last 2 years (since the last Natrakelp News), AgriSolutions too has developed and changed and will continue to do so to meet your and your customers' demands.

No longer aligned with only one brand name, AgriSolutions is now strongly positioned to advance the application of kelp, seaweed and fish in most farming and growing situations. With some 18 years of diverse sales and application experience, you are ensured of getting the best advice for whatever your growing situation.

Using the results of independent soil, foliage or water testing, the application of various fertilisers plus, where necessary, the adoption of appropriate and agreeable management changes will undoubtedly reward you with increased and sustainable profit. The intention is to explore and implement more natural farming methods with which you can become comfortable.

You may not realise the full value of sea-sourced additives applied to your soil, plants or stock. Nutrients are finally returned to the land, from whence it originated, in the form of seaweed, kelp and/or fish. The ultimate in recycling!

The benefit of supplying the vast range of naturally occurring trace elements, chelated minerals, vitamins, amino acids and naturally occurring growth hormones goes way beyond comparing any of these inputs to commonly used fertilisers, stock supplements and plant growth aids. Like no other additives, the complex of components in seaweed, kelp and fish contribute enormously to the overall performance and health of soil, plants and animals. In this regard it is inappropriate to compare seaweed, kelp and fish based fertilisers to standard fertilisers because of the additional benefits received from the sea based products.

And remember it is the journey to success that is always more rewarding than the success itself.

As is our belief in the knowledge that fundamentally more farmers and growers will seek natural, cost effective and successful inputs to make their enterprises more sustainable and profitable.
